Olympic Games turns to be a main point in any sportsman life. It is a competition, where the best of best wins, and where the winner becomes a national hero. This is the reason why the winning in this sports event is a top in any athlete career. The battles on the fields of sport attract the attention of everybody: the poor and the rich, politics and businessmen, house-wives, children, elder ones... Mostly the tickets to the competitions are sold long before the first starts and tribunes are overfilled. Unfortunately this very huge amount of people - not the sports events themselves - attracts those, whose interests lie in a very different sector: the terrorists

As any other mass event, the Olympic Games are a "tasty cake" for terrorists. Their aim is to attract the attention, to frighten people killing them as many as possible. And for sure - after acts of terror with hundreds, and sometimes even thousands of innocent victims, there rises a thunderstorm of emotions as well as the fear for one's relatives' lives. We can easily remember our own feelings when watching TV, where the ruins of houses in Moscow or Volgodonsk or burning underground trains, or skyscrapers ruined in New-York were shown. Unfortunately, recently this list contains a lot of other examples. And in addition, the Olympics are collecting people from different countries, with different skin-color and different religions.

Anti-terror operations already became one of the main task of security services from a number of countries of the world. Yearly they spend billions of dollars to protect themselves, but unfortunately day after day we hear about new acts of terror all around the world. So we are interested, what have the Greece security done to let us remember the coming Olympics 2004 in Athens as a great sport event - not as a grave for thousands?

Short history remind

1972
Munich. Germany.

The members of palestinian terror organisation "Black September" had taken Israel sportsmen as a hostages right in a building of Olympic Village. They killed two hostages and got the helicopter. The policemen and snipers start shooting - but unsuccessful. All hostages were killed (11 persons). The caught terrorists were ex-traditioned to arab countries and soon all of them were free. Prime-minister of Israel Golda Meer ordered to five secret agents to find and kill terrorists. It was done. Three of five agents were lost during mission.

1996

Athlanta.USA.

An unknown man has blowed up a bomb filled with nails in a city park. One man was killed and more then a hundred were wounded.

Security and Records.

In February 2003 the government of Greece has declared, that it will increase with 8 up to 10 thousand the number of military men of safety forces responsible for a safety of Olympiad tournaments in Athens. Besides that 40 thousand more military men will be on fighting watch and ready to protect sportsmen and visitors of games from acts of terrorism (this number is three times more than on Olympiad in Sydney in 2000ã.). And after explosions thundered in Athens in May 2004ã., the number of employees providing safety, have been solved to increase up to 20 thousand, that in total will make more than 70 thousand, and the general budget of a safety of Olympic Games has increased by ^350 million, and makes ^1 billion (\$1,2 billion). If we shall recollect Olympiad in Salt Lake City we shall remember, that in protection of the order in streets of city service and on sports-objects it has been involved 15 thousand employees of security services (on a safety it has been allocated \$400 million).

Even in Afghanistan during antiterrorist operation, American forces were used in less number. However at interrogation, 80 % of respondents in spite of that felt themselves not in safety and were afraid of new acts of terrorism in capital of Olympic Games. From May, 14 till May, 21 2004 research company MRB Hellas carried out interrogation of Greece citizens, and among other questions there was - whether " the security service will admit carrying out terrorist acts? ", - 86,3 % interrogated have answered negatively. Probably naive citizens of Greece think, that the more they spend for the safety, the more protected they will be! It is necessary to ponder upon these figures - \$1,2 billion in Athens, against \$400 million in Salt Lake City (2002)! If we will recall Atlanta - it was been spent for safety of Olympic Games as "little" as \$96 million. Nevertheless - expensive does not mean good! Forthcoming Olympic Games will be one of the most expensive in history, for its organization it is spent \$7.3 billion!

Who will protect the Olympics?

Certainly, struggle against terrorism is a problem of everyone, on this for participation in it, the state involves commercial structures (firms-developers of antiterrorist techniques, the private security enterprises, etc.). The coming Olympiad did not became an exclusion from this rule. On January 22 Greece government has announced the tender on a safety for Olympiad - 2004 not validated. According to agency ANA information, any of the companies which have put forward their projects on the tender, has not requested for the services less then \$300 million while conditions of competition provided expenses not above \$260 million. But, at repeated carrying out of the tender, the winner appeared American company SAIC (Science Applications International Corporation), whose project costs \$280 million (A good part of a budget on a safety of games), according to other source - \$320 million. Quite a nice sum of money! So what is this winner-company? Can it really protect the competitors and guests from extremists' acts? The most complete picture about the company gives the chapter "Secrets of elections. Closed joint-stock company of authority." from the book by Kivi Bird "Gigabits of authorities. Information technologies between freedom and totalitarianism".

["We are an invisible-being company," - one of top-managers of SAIC Whale Nightingale, in the past the colonel of division for special actions of the American army has confidentially](#)

informed in interview. - "we are everywhere, but almost nobody does notice it ". Californian headquarters of SAIC is located on northern suburb of San Diego, and externally its well-groomed campus differs nothing from all other constructions of a similar sort. However inside the armed security forces are staying everywhere, doors are locked on safe locks, and many rooms are shielded from compromising electromagnetic radiations. For many years milliard incomes of the company were almost completely provided with contracts of the Federal Government of the USA. A significant part of them are tasks of investigation: development of powerful computer systems for the data analysis (data mining), the software for satellites of specific investigations, a special equipment for systems of supervision. Besides performance of investigating services contracts, SAIC corporation develops computer maintenance for submarines and jet fighters, participates in creation of systems for antimissile defense and underground nuclear bunkers in Nevada, ensures the functioning of national system of the account of crimes (FBI), and also has the contract with federal tax service of the USA as an administrator of the financial information. One more sphere of business roughly developing recently - developing a wide sort of system for new Department of safety of fatherland, like scanning devices scale-radiation based, that can scan the contents of sealed up containers and lorries.

In 1996ã. SAIC, on behalf of the governmental departments of the USA organized competition on carrying out the research works - " Russian technologies of monitoring". This program was carried out in Russian Federation with an aim to reach a perfection of national and international measures of monitoring observance of the international agreements on restriction, prohibition and destruction of various kinds of the weapon of mass defeat and its non-distribution. We can only guess, what a "brain-leakage" and technologies loss it turned to be for our country.

The aura of secret is a constant surrounding for SAIC that employs a huge amount of former special services agents, military structures commanders and heads of justice departments. The permission to work with the state secrets have more than 5000 workers of SAIC, and its founder and unchangeable chief Robert G. Bester, as it is used to say, has the highest admission to the state secrets which was ever given out to civilian citizens of the country. The most noticeable detail of SAIC is its Directors' Board. The exact number of people in this collective is never known, because (as it is informed on a site of the company) it varies within the limits of 12-22 persons. Besides there is also a special mechanism of indispensable rotation - annually the structure is updated on third with the invitation of new directors for about three-year period. The former directors often leave the business for some new high state rank.

As a whole, the names of this "roundabout" people impress a lot: Admiral Bobby Inman, former director of National Safety agency and deputy director of CIA; Melvin Laird, minister of defense in president Nikson government; general Max Thurman, that was a commander for Panama intrusion; Donald Hicks, that was a head of researches and developments in Pentagon; Robert Gates, former director of CIA; William Perry, the Defense minister in Klinton administration; John Doich, also former CIA director... And so on.

Among the latest director it's necessary to mention the retired general Wayne Dauning, member of "Committee for the Liberation of Iraq" Council, and right before the war - the main lobby of American-made "Iraq National Congress" and its head Ahmed Chalaby. Previously we've already mentioned another high military admiral William Owens, that is the main executing director and vice-chairman of SAIC directors' board. He simultaneously presents in five different companies councils, and all of them are pumping over billions of dollars from "Iraq Donations"; and also he is the member of Advisory political council of Pentagon, that is preparing the strategy for Defense minister Ramsfield. Now you can generally imagine the

essence of rather profitable private enterprise SAIC with its nourishing sucking from a rich state feeding trough. From the period of Richard Nixon when nuclear-physician Robert Bester has founded his "closed joint-stock company" in 1969, each of US Presidents had somebody from SAIC directors' board in his closest surrounding. Due to doubtless organizing talents of Bester and so favorable position of company at authority, absolutely all years of existence of corporation were profitable for it - despite of economic recessions, political problems and other disorders of a society life. The income of a firm, belonging to its employee, had grown from 243 thousand dollar in 1970 to 6 and more billion dollars in 2003.

In November 2003 Robert Bester, that got 78 y.o., decided to leave the key posts of the president and executive director of corporation, having invited instead Kenneth Dalberg, vice-president on information technologies from General Dynamics corporations. For himself Bester has left a place of the directors' board chairman of SAIC. It is considered, that only at the present state administration of the Bush-son rough privatization of favorable state orders has become in USA so frankly unethical - at a sight of many, simply ugly - the forms testifying to irrepressible avidity of the high-ranking state officials. As a brightest example of the situation it is used to mention Halliburton company (oil, constructing, military), that got the many-billion contract for reconstructing of Iraq oil industry "without competing" with only one reason: its former director was Dick Cheney. To tell the truth, this way of giving state orders "to self friends" was constructed long ago and with the direct participation of SAIC. So there is no wonder at all, that SAIC corporation was among the first ones, who got the profitable contracts in Iraq - even several months before the war started.

Pentagon had paid 96 million dollars to Harris company for supervising of television and radio network, that was previously owned by Saddam Hussein. Now its name is "Al Iraq". The contract was transferred to Harris after SAIC had failed to attract Iraq audience - their broadcasting was too pro-American.

The size of Iraq piece of cake you can imagine according to Wall Street Journal , that called the Iraq project "the biggest reconstructing works of US government from the times of Germany and Japan reconstruction after Second World war'. The definite amounts of American tax bearers money, that are supposed to be spent for the project are still unknown. But it is clear already, that Bush administration has in addition requested in September, 2003 87 billion dollars, besides those 3,7 billion that are allocated for Iraq monthly. According to rough estimates, for the nearest years this sum in total can grow up to 200-500 billion dollars.

For today SAIC, probably, is the most influential company in the American state administration and the majority of people never heard about it. The Federal Government - as the main customer - usually does not wish at all, that public knew anything about the things that SAIC is engaged in. And thanks to its statement of "Closed joint stock venture" - very unusual for the company that is involved in state orders, for SAIC it is possible to stay constantly outside of reach of burdensome checks of financial bodies and the concerned investors. One more of the important features in SAIC activity is the powerful diversification of its business and huge quantity of rather small orders. In 2003 the corporation simultaneously worked on 8 and more thousand contracts - and 5300 of them were the contracts from US government, mostly special services and Pentagon.

Let's remember, that Pentagon in September 2001 became a target for one of the terrorists-directed planes, and the point of explosion was the part of a building where anti-terrorist department was located. So is it possible for Pentagon with SAIC to protect the Olympics from possible attacks, if they cannot defend themselves?!

When Pentagon decided to collect and prepare a team of Iraq emigrants as a help to US forces in reconstruction of ruined Iraq, the contract for this job was given to SAIC. When Maryland Governor Robert Erlih decided to organize the expertise of electronic electing devices security before buying them, he concluded a contract for that with SAIC. When US army started to solve a delicate problem of utilization of old chemical weapons on Aberdeen Proving polygon, the contract also was passed to SAIC. National Cancer Institute (USA) has addressed for the help to SAIC at the organization of works in the Frederick research center (Maryland) - within the 1.25 billion dollars contract 1500 employee of the corporation are engaged, among other, in a research of different aspects of the biological weapon usage. SAIC conclude very unusual contracts sometimes.

For example, Traffic Safety Administration (TSA) has decided, that it hardly need help to utilize a huge amount of different things, that are being confiscated while passengers' luggage examination (new rules after September, 11, 2001) - little scissors, defense sprays, celebratory crackers, knives, etc. Somebody could suppose that it should be cheaper to arrange little companies, working in airports for dealing with all this stuff. But the government officials of USA have their different opinion, and a many-million contract for this work was concluded with SAIC, of course.

One of the most important sectors of the corporation activities is informational-technology special. In SAIC laboratory in Annapolis (Maryland), close to Fort-Mid - the headquarters of National Safety Agency - the team of 150 employees works on a new software for NSA - a software for data scanning and effective analysis of huge information stream, coming from radio interceptions collected from the communication nets all around the world. The declared cost of this super confidential project which has received code name Trailblazer reaches 282 million dollars.

SAIC with several other companies of the USA, has received the order cost \$252 million on development of the information weapon samples of "defensive and offensive character". The companies undertake to carry out a full cycle of research and development, including integration of the received samples into a working information infrastructure of US-army, their adjustment and the subsequent maintenance service. The program is to be fulfilled till August 2009.

Here is one more example - very fresh one. In November 2003 under the pressure of Federal Communication Commission (FCC) in USA there have taken effect new rules according to which all users of cellular telephones now can reserve there own telephone number, passing from one provider of mobile communication to another. FCC has put these rules into practice to great pleasure of public, despite of the strongest protests and resistance on the part of the telecommunication companies losing the reliable tool of a binding of subscribers to their services, and instead - receiving just new technical problems. If we will remember the set of rather unpopular decisions that FCC made during the time while it is headed by Michael Powell (the son of the state secretary of Bush administration, general Kolin Powell), such care of simple citizens needs looked rather unusually, as we can see.

But soon all became much clearer when it was found out, that corporation SAIC has been actively involved in this project. Probably, the special services got tired while listening to cellular telephones with a situation when subscribers of mobile communication change their numbers at change of the provider. Interests of subscribers and those who are to watch them have completely coincided - and here at the state level the firm decision on constant fastening number for the owner is accepted. Well, technical maintenance of a delicate affair have been charged to SAIC as usual. The corporation has employed 90 persons which

approximately for three months have created a system of telephone numbers exchange between providers.

When it is going on like this, one can hardly be surprised, that the support of a major important problem of realization the electronic systems of voting have been charged the most reliable firm - Science Applications International Corp.

And we are not surprised with the information, that was given to prime-minister of Greece Kostas Karamanlis by the minister of social safety of Greece Jorgus Vulgarakis after his staying in USA for the discussions of Olympic problems with American officials. The negotiators from USA were American President's advisor Kondoliza Rice, CIA and FBI Director, national safety secretary Thomas Ridge and US deputy Secretary of State Richard Armitage. The information was that Washington is satisfied with the results of works for the Games Safety - according minister's words. Well, why not!? Greeks officially announced that they are supposing "Al Kaida" acts of terror and rely to America help! OK, Greece is NATO country, and the competition between companies for the contract of safety procedures could be won by NATO-country company only. And closest to Pentagon company is SAIC - most profitable decision for USA.

SAIC - will be responsible for non-failure operation of the equipment established in more than 100 centers of security services - in Athens and vicinities of the Greek capital. Besides the corporation has delivered to Greece about 1250 watching cameras for transport movement on city highways controlling. The special cameras developed by SAIC, also will be established on helicopters and balloons providing safety of Games from air.

Together with companies Motorola and Siemens, SAIC will engage in maintenance of the protected radio communication. The system of communications will be based on TETRA standard (Terrestrial Trunked Radio) - the unique open standard of the protected radio communication that was confirmed by European Institute of Standardization for Telecommunications (ETSI).

... That is our common business!..

In the middle of 90th years the international terrorist community began to be formed. So, in 1995 in Sudan has taken place the meeting of the Islamic extremist and terrorist organizations. On the agenda of meeting there was a question of a network of representations of the international Islamic movement creation. Struggle against terrorism also is not possible without consolidation of all world community for termination of social, economical and ideological roots of this phenomenon. But not everybody wants to unite for the real struggle. Some countries - USA for example - show their wish to fight extremism and terrorism in "tete-a-tete" way. According to the information of Greek Embassy, "Russia is an eighth country in the contact group formed for the Olympic Games safety. Also this group includes USA, Canada, Australia, Spain, Great Britain, Germany, France..."

Let us pay a special attention to the first place of USA and the eighth place of Russia. That was done specially. Cooperation of the countries that join the international anti-terrorism coalition is very weak. The USA persistently aspires to operate unilaterally, use double standards without mentioning the opinion and interests of other countries. Olympiad 2004 becomes one more vivid example.

Russian technologies

While SAIC is developing the computer systems of data analysis, Russian specialists are already using them! The clear example for that is the information and programming complex "Trend", that proved its effectiveness both for business and State safety. Lets use it to make a forecast of an act of terror possibility during the summer Olympic Games 2004 in Athens. To do it we ask for a help the representatives of developing company "Verbin and partners":

Estimation of comparative probability of possible acts of terrorism and the forecast of tendencies of the intensity growth connected to safety on summer Olympic Games in Athens (Greece).

The resulting forecast shows the appearance of some factors, influencing the surrounding and making it more dangerous according to the possibility of terrorism acts in Athens during the Olympic Games 2004. These factors are directly connected to the growth of terrorism in the world and in Greece separately. The most probable possible kinds of acts of terrorism, taking into account mass character of spent actions and their international value, can be explosions, stealing of an air vessel, biological and chemical terrorism, capture of hostages, other kinds of terrorism (exotic, for example, cyber-terrorism, information terrorism) are not excluded. On the histogram pict.1 it is shown the distribution on intensity of consequences and gravity of kinds of the terrorism acts scored for conditions of 2004 Olympic Games in Greece. The forecast of tendencies of threats of the majority of the mentioned kinds of terrorist activity shows on their decrease that can be caused by corresponding preventive work and preventive actions of the Greek and international special services and the police forces directed on a safety of participants and visitors of Olympiad. (On piñt. 2 linear trends

ОЦЕНКА НАПРЯЖЕННОСТИ ПО ВИДАМ ТЕРАКТОВ

ОЦЕНКА ИЗМЕНЕНИЯ ВЕРОЯТНОСТИ ПО ВИДАМ ТЕРАКТОВ НА ОЛИМПИАДСКИХ ИГРАХ 2004 ГОДА В АФИНАХ

for an estimation of change of probability of various kinds of terrorism are shown.) However the calculations lead during automated forecasting specify that in first half of Games with probability more than 70 % can be shown the factors influencing approach of a situation leading such kinds of terrorist acts as explosion which while are estimated as casual.

P.S.:

According to CNN, in May 2004ã. the American special services have received the

information, that "Al Kaida" group and the terrorist organizations connected to it plan to carry out this summer new large act of terrorism, but nothing is know about an exact place and time of terrorists' attack. In the information some probable targets of the acts were called, but FBI and other special services of USA are mostly worried about the safety of the Americans on the summer Olympic Games in Athens..." - as you can see, there are key-words "safety of the Americans" in this information. So who will be defended by the expensive SAIC system? After explosions in Athens in May 2004, according to Australian newspaper The Canberra Times, Australia will send its special military forces to defend its sportsmen during the Olympics. This decision was approved by Greece government and International Olympic committee. And whay about Russia? Russian delegation (750 participants) will be officially defended by 10 special agents. And unofficially there will be several men in civil clothes, but their only function is to inform Greeks about possible danger. And any weapons for them are forbidden completely!
